Task 3 First Draft Team Guide

GPU sharing for multi-tenant inference | Prepared 24 October 2026

Use the new 30-study package for all further checking. Keep the two older ZIPs as backups. We have assembled the report and supporting evidence, but we have not completed every full-text eligibility decision in the wider review. This guide explains what changed, where each file is, and exactly what to check before the Sunday 25 October submission.

What is complete and what is still open

Measure	Verified position
Older shared package	20 unique studies, 21 reports, 200 QA items and 52 outcome rows
Current assessed package	30 unique studies, 31 reports, 300 QA items and 90 outcome rows
New papers	10 additions; each has six eligibility checks, ten QA items, extraction and a reference entry
Source PDFs	All ten added PDFs recovered and matched to their assessment hashes
Continuation screening	559 of 559 decisions recorded: 225 excluded and 334 advanced
Continuation eligibility	14 of 334 advanced records closed: 10 included and four excluded; 320 deferred
Full SLR completion	Incomplete eligibility, historical search provenance and independent checking remain

The earlier 100% referred to assembling a bounded draft package. It did not mean that the entire SLR or every guideline requirement was fully closed. There is no defensible single percentage for all research work because the remaining records differ in effort and evidence availability.

A record is a database entry. A report is a paper version. A study is the underlying investigation. The two linked REEF reports count as one study, which is why 31 reports represent 30 studies.

Screening-stage completion does not mean that every abstract was available. The report identifies title or metadata-only decisions and 163 records without recovered abstract text. Evidence levels remain explicit in the screening log.

Which files to use now

File or folder	Use
01_Report/CEP_Task3_First_Draft.pdf	Read the current typeset report. Use its printed sections and study IDs for comments.
01_Report/CEP_Task3_First_Draft.docx	Leave review comments or tracked edits. Word edits do not automatically update LaTeX.
02_Master/CEP_Task3_Evidence_Workbook.xlsx	Use this database as the current master. The older database is a historical backup.
03_Data_and_Logs	CSV copies of the main tables, screening decisions, criteria, QA, references and remaining queue.
04_Team	This guide, paper map, deliverable checklist, individual check queues and correction inbox.
05_Added_Paper_PDFs	Ten source PDFs in the private team ZIP. Public GitHub contains source links and hashes instead.
06_Protocol_and_Guidelines	Original submitted protocol and the exact guideline PDF shared in this chat.
Task3_LaTeX_2026-10-24	Separate runnable LaTeX project. Upload its ZIP to Overleaf or use the build commands in its README.

The new folders supersede the two older ZIPs for editing. Previous checks are still useful: copy a correction by study/report ID into the current correction inbox. Do not silently replace the new master with an older workbook.

How to open and start

1. Download and extract the new team ZIP. Keep its folders together.

2. Open this guide, then open the report PDF and the master workbook.

3. In Excel, open Studies. Search your study ID, for example S028. Read its report ID, DOI and QA denominator.

4. Open the matching source PDF from 05_Added_Paper_PDFs using the paper map.

5. Open your Eshaal_Checks.csv or Rameen_Checks.csv. These are blank check records; they are not claims that you already verified anything.

6. Read the source anchor, compare it with the recorded claim and enter an actual finding. Return the completed CSV and any Word comments to Raazia.

The ten papers added after the frozen version

Study and report	Paper	Checker	Outcomes
S021 / P024	LithOS	Eshaal	2
S022 / P025	Abacus	Rameen	2
S023 / P026	Miriam	Eshaal	2
S024 / P027	SGDRC	Rameen	2
S025 / P028	Pantheon	Eshaal	3
S026 / P029	Oneiros	Rameen	3
S027 / P030	GACER	Eshaal	4
S028 / P031	ElasticRoom	Rameen	8
S029 / P032	SPLIT	Eshaal	6
S030 / P033	KACE	Rameen	6

Each paper already has a source-based eligibility decision, ten QA items, extraction fields and cited findings in the draft. The ten additions contribute 60 eligibility checks, 100 QA items and 38 outcome rows. The older set contributes the other 200 QA items and 52 outcomes. These are item counts, not paper counts.

The private bundle contains the ten new PDFs only. It does not claim to newly recover every original paper. Use earlier reading copies or the original source register for the older studies. Preserve any actual access/version limitation.

What Eshaal and Rameen should do

The suggested split gives each checker five added papers. First confirm the publication identity and eligibility. Next check the main reported finding and its use in the report. Then inspect the QA and other assigned outcome rows. The CSV assigns every item, but you must leave an item unverified if you have not checked it.

Eshaal also checks Results, Comparison and Discussion. Look for percentages with the correct baseline, mean versus tail latency, and adverse results. Rameen also checks Methodology, Study Selection, QA and References. Check the 30/31 distinction, claim-specific N/A denominators and current counts.

Use your previous completed reviews for the original studies. Give priority to source identity, the central numerical claims and recommendations. Cosmetic rewriting can follow. The new queues are suggested independent checks, not a replacement for actual protocol requirements.

How to check one paper step by step

Publication identity

Compare the PDF first page with Studies and New_Paper_Map.csv. Check title, authors, year, venue and DOI. A preprint and a final paper can differ; record the actual version.

Eligibility

Read IC1 to IC6 in the protocol and the recorded criterion anchors. Confirm a relevant sharing mechanism, separable inference evidence and a within-one-GPU result. A download or abstract alone is insufficient.

Quality appraisal

Find Q1 to Q10 in the QA sheet. Read the rationale and cited page. Check the score against the scoring rule. N/A must mean that the paper does not make that type of claim; it must not conceal missing evidence for a claim.

Data extraction

Compare mechanism, hardware, workload, tenant count, load, baseline and metric definition with the paper. Keep the source conditions attached to the result.

Outcome and synthesis

Open Evidence and locate the outcome ID. Verify value, units, comparator and source anchor. Find the corresponding claim in the report, then check that its conclusion respects the source limits.

Return a correction

Enter the item ID, source page, actual finding, checker name and date. Use Agree or Correction needed only after reading the relevant evidence. Put proposed changes in the correction inbox and let Raazia update the master once.

Example: KACE reports 92.3% of an offline oracle throughput sum for its unseen GPT2-xl target. This is not a 92.3% latency reduction or a p99 guarantee. A correction must preserve the metric, target workload and oracle denominator.

Example: SPLIT uses block-execution-time dispersion as a jitter measure. Do not rename it end-to-end request-tail jitter. Some splits add execution overhead; keep those adverse costs in the review.

How Raazia should merge corrections

Keep one master workbook and one LaTeX project. Check each proposed correction against its source, update the owning data row and any affected report claim, then rebuild the PDF. Update the Word companion after accepted changes. Recheck counts only when an eligibility or identity decision changes. Record the final Git commit and submitted file hashes.

Sir mandatory deliverables

Heading 23 lists 25 deliverables. The following table maps every item. Present means that draft content exists; it does not certify that the associated research question or audit is fully closed. Guideline_23_Deliverables.csv contains the full actions and file locations.

No	Requirement	Location	Status
1	Final SLR report	01_Report PDF and Word	Draft prepared
2	Defined engineering problem	Report section 1	Present
3	Research objectives	Report section 1	Present
4	Three to five RQs	Report section 2	Present
5	SLR protocol	06_Protocol_and_Guidelines and methodology	Present
6	Databases and justification	Report section 3 and Search_Log.csv	Present
7	Exact search strings	Report appendix and search register	Partly closed
8	Inclusion and exclusion criteria	Report section 3 and Eligibility.csv	Present
9	Database wise search results	Search_Log.csv and report section 4	Partly closed
10	Search and screening log	Screening_Log.csv and Final_Screening_Decisions.csv	Partly closed
11	Duplicate removal record	Duplicate_Removal.csv and identity audit	Documented with limits
12	PRISMA flow diagram	Report section 4 and counts.tex	Partly closed
13	QA checklist and scores	Master QA and Final_Candidate_QA.csv	Source appraisals present
14	Included primary studies	Master Studies and Source_Register.csv	Assessed set present
15	Extraction sheet	Master Extraction and Evidence	Present
16	Taxonomy	Report section 5 and Taxonomy.csv	Present
17	Comparative evidence matrix	Report section 7 and Comparability.csv	Present
18	Engineering trade offs	Report section 8	Present
19	Conflicting evidence	Report section 9 and comparison tables	Present
20	Answers to all RQs	Report section 6	Present
21	Engineering recommendation	Report section 10 and Recommendations.csv	Present
22	Research gaps	Report section 11 and Research_Gaps.csv	Present

No	Requirement	Location	Status
23	Threats to validity	Report section 12 and Validity.csv	Present
24	Complete references	Report references and references.bib	Present with version limits
25	Supporting verification files	03_Data_and_Logs and repository history	Present with limits

How headings 24 to 27 apply

Heading 24 is the report structure. The current report has all thirteen main sections: Introduction; Research Questions; Methodology; Study Selection; Taxonomy; Results by RQ; Comparison; Trade-offs; Discussion; Recommendation; Research Gaps; Validity; Conclusion. References and evidence appendices follow. The appendix paper cards support the synthesis; they do not replace analysis across papers.

Heading 25 asks for critical analysis. For each recommendation, explain which mechanism fits which workload, what evidence supports it and what cost must be accepted. Do not rank unrelated percentages as though the papers used one experiment. Mean latency, p99, batch completion, block dispersion and throughput sum remain distinct.

Heading 26 asks for traceability and reproducibility. Every included study needs an identifiable source, every decision needs evidence, and every PRISMA count needs a real log. The current source/QA/extraction records are present. The 320 deferred records and historical search gaps mean that full compliance is still incomplete. They must remain visible.

Heading 27 is the final engineering answer. Read the recommendation section and ask: what should an engineer select, under which conditions, why, with which benefit and sacrifice, and when is an alternative preferable? Every answer must point back to the reviewed evidence.

Work before Sunday submission

1. Start with this current package and transfer any older corrections by paper ID.

2. Eshaal and Rameen check their assigned sources and the report sections above. Return concrete corrections, not a blanket approval.

3. Raazia reconciles corrections, regenerates affected outputs and checks the final report against the guideline matrix.

4. Keep the 320-record queue separate. If further records are actually assessed, apply the criteria and rebuild the corpus-dependent outputs. Do not mark that queue complete merely because the draft minimum is met.

5. Confirm cover details, submission instructions, required individual submissions and file opening. Record the exact final version before sending it to Sir.

The current draft can be reviewed as a bounded first draft. Approval cannot be guaranteed, particularly while systematic selection and historical search reconstruction remain incomplete. The most useful work now is genuine source checking and correction of substantive claims, followed by a single consistent submission version.
